背景介绍	This gene is a member of the regulatory factor X gene family, which encodes transcription factors that contain a highly-conserved winged helix DNA binding domain. The protein encoded by this gene is structurally related to regulatory factors X1, X2, X4, and X5. It is a transcriptional activator that can bind DNA as a monomer or as a heterodimer with other RFX family members. Multiple transcript variants encoding different isoforms have been described for this gene. [provided by RefSeq, Aug 2013].
组织表达	Muscle, Testis.
细胞定位	Nucleus.
功能	function:Acts as a transcription factor. Represses transcription of MAP1A in non-neuronal cells but not in neuronal cells. similarity: Belongs to the RFX family.
纯化	The antibody was affinity-purified from rabbit antiserum by affinity-chromatography using epitope-specific immunogen.
